Spiral galaxies	Elliptical galaxies	Irregular galaxies
•We are part of the Milky Way galaxy.	•It looks like flatten balls or a Pancake.	•They do not have regular shapes.
•The center is hidden from our view by massive clouds of stars, gas, and dust between the Sun and the center	•Elliptical galaxies only contain old stars.	•The large magellanic cloud is an irregular galaxy about 169,000 light years away from our galaxy.
•The center of our galaxy is about 25,000 light years from the Sun.	•Elliptical galaxies contain billions of stars but have little dust and gas between the stars.	•At this distance it is one of the closest neighboring galaxies in the universe.
